Conclusion

- The classical measurement error model does not represent recall errors adequately
- Retrospective reports of times to onset/end or durations of an event cannot be negative and will tend to be more accurate the shorter the recall timespan
- e.g. jobseekers' reports on how long they have been unemployed
- Multiplicative models are elegant solutions;  $X^* = X \cdot U$
- Can also be used to model telescoping effects: for forward telescoping  $U \sim N(< 1, S_U^2)$ , for backward telescoping  $U \sim N(> 1, S_U^2)$

We substitute step 1,

$$X_k^*(\lambda_k) = X^* + \sqrt{(\lambda_k)}U$$

by either:

$$X_k^*(\lambda_k) = \exp \left\{ \log(X^*) + \sqrt{(\lambda_k)} \log(U) \right\}$$

(Carroll et al, 2006)

$$X_k^*(\lambda_k) = X^* \cdot U^{\lambda_k}$$

(Biewen et al., 2008)

Results

Conclusion

- SIMEX is a good candidate to be used as a sensitivity tool when recall errors are suspected:
  - Can be easily modified to accommodate memory failures in the form of multiplicative errors
  - By shifting the mean of the simulated errors up or down we can account for backward and forward telescoping effects
  - Easy to implement regardless of the complexity of the outcome model

Conclusion

- SIMEX is a good candidate to be used as a sensitivity tool when recall errors are suspected:
  - Can be easily modified to accommodate memory failures in the form of multiplicative errors
  - By shifting the mean of the simulated errors up or down we can account for backward and forward telescoping effects
  - Easy to implement regardless of the complexity of the outcome model
  - It can be particularly useful when no alternative data is available and all we know stems from previous validation studies
  - In all of the 144 estimates studied here SIMEX managed to reduce the bias found in the naive model by at least 22.6%
  - There are commands to run standard SIMEX in STATA and R, incorporating extensions for multiplicative errors would make it even easier for everyone to consider sensitivity analysis when using retrospective data.
